# Convexity And Correlation Effects in Swap Pricing 

Thomas S. Coleman

## Overall Themes

- Discounting Expected Cash Flows
- Use Simplest Model Which Solves Problem
- Focus on Hedging and Managing Risks

## Correlation - Spread Options

- Products which naturally incorporate correlation
- Single yield curve spreads
- Across yield curves - swap spreads
- Across yield curves - Gilts vs. Bunds
- More complicated - index amortization swaps

## Spread Option - Example

- Focus on specific example - call on 2 vs. 10 year swap yields
- Two contrasting views
- Two underliers: $\mathrm{Y}_{10}-\mathrm{Y}_{2}$
- Correlation matters
- One underlier: $\mathrm{S}_{10 \mathrm{vs2}}$
- Correlation only enters indirectly

## Spread Option - Pricing Theory

- Discount ECF using risk-neutral measure
- Take expectation of payout:

$$
\mathrm{E}\left[\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)-\mathrm{K} \mid\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)>\mathrm{K}\right]
$$

Or

$$
\mathrm{E}[\mathrm{~S}-\mathrm{K} \mid \mathrm{S}>\mathrm{K}]
$$

## Spread Option - Pricing Theory

- Principle of using simplest model which fits
- Here we can use simple model
- Option is European
- Depends on two variables $-\mathrm{Y}_{10} \& \mathrm{Y}_{2}$

## Spread Option - Pricing Theory

- Now must make some decisions
- What are some reasonable assumptions about $Y_{10}, Y_{2}$, and $S$ ?
- $\ln \left(\mathrm{Y}_{10}\right) \& \ln \left(\mathrm{Y}_{2}\right)$ jointly normal with correlation $\rho$
- S normally distributed with standard deviation $s$
- Introduce a new variable - $\rho$ or $s$

## Spread Option - Pricing Theory

- Focus on normal spread model

$$
\mathrm{NPV}(\text { call })=\mathrm{DF}(3 \mathrm{mth}) \int_{\mathrm{S}=\mathrm{K}}^{\infty}(\mathrm{S}-\mathrm{K}) \mathrm{g}(\mathrm{~S}) \mathrm{dS}
$$

$$
g(S)=\frac{1}{\sqrt{2 \pi s^{2} t}} \exp \left(\frac{(S-F)^{2}}{2 s^{2} t}\right)
$$

$\mathrm{NPV}=\mathrm{DF}(3 \mathrm{mth}) \mathrm{st} \cdot{ }^{5}[\phi(\mathrm{~d})+\mathrm{d} \Phi(\mathrm{d})]$ $\mathrm{d}=(\mathrm{F}-\mathrm{K}) / \mathrm{st}^{5}$

## Spread Option - Practical Pricing

- Pricing - must come up with inputs
$-\mathrm{F}_{10}$ and $\mathrm{F}_{2}$ off of forward curve (but see convexity adjustment below)
- s - Standard Deviation of spread
- S.D. depends on correlation
$\operatorname{Var}(\mathrm{S})=\operatorname{Var}\left(\mathrm{Y}_{10}\right)-2 \rho \mathrm{SD}\left(\mathrm{Y}_{10}\right) \mathrm{SD}\left(\mathrm{Y}_{2}\right)+\operatorname{Var}\left(\mathrm{Y}_{2}\right)$
- Trading decision on level of $s$ or $\rho$

## Spread Option - Practical Pricing

- For US
- 3 mth fwd 2 year rate
- 3 mth fwd 10 year rate
- Forward spread
- LN volatility of 2 year
- LN volatility of 10 year
- Historical correlation
- Spread standard deviation
6.23
6.96
73.8bp
20.0\%
16.5\%

93\%
46 bp

## Spread Option - Pricing and Risk

- Resulting Spread Option Price
- Three month call option, ATM
- Price 9.1bp
- Benefits if spread widens
- Three month put option, 10bp OTM
- Price 5.0bp
- Benefits if spread narrows

## Spread Option - Hedging

- Must hedge against movements in either
- yields, vols, correlations
- Spread, standard deviation of spread
- Two ways of saying same thing

## Spread Option - Hedging

- Difficult to hedge
- Flip side of difficulty in choosing level of $s$ or $\rho$
- Usually must live with the correlation / spread standard deviation risk
- To hedge trade the spread - delta hedge

## Spread Option - Risk Measurement

- Two ways of measuring risk for ATM
- Risks to spread and spread std. dev. 1 bp in spread 0.5bp 1bp in std. dev. 0.2bp
- Risks to yields, vols, and correlation

1 bp in $\mathrm{Y}_{2} 0.5 \mathrm{bp} \quad 1 \mathrm{bp}$ in $\mathrm{Y}_{10} 0.5 \mathrm{bp}$
1 vol pt in $\mathrm{Y}_{2} 0.5 \mathrm{bp} \quad 1$ vol pt in $\mathrm{Y}_{10} 0.1 \mathrm{bp}$
1 percentage point in correlation 0.6 bp

## Spread Option - Hedging

- Either way, delta hedge spread
- When buy call, hedge by selling spread
- To sell yield spread buy $10 \&$ sell 2 yr swap
- Buy / sell 3mth forward swaps
- Buy / sell DV01-weighted amounts
- Call changes by 0.5 bp for 1bp change in spread
- If payout $\$ 10,000 / \mathrm{bp}$, call changes by $\$ 5,000$
- Buy 7.1mm 10s, 27.4mm 2s

## Model Choice - Simple vs. Complex

- Advantages of simple models
- Easier to understand and implement
- Focus directly on important aspects of problem (pricing \& hedging correlation of $\mathrm{Y}_{10}$ and $\mathrm{Y}_{2}$ )
- Advantages of complex models
- General model works in variety of applications (e.g. simple model might predict spreads widen without limit for long-dated options)
- No need to force problem to fit model

## Convexity - Adjusting Forward Rates

- Call as expectation of payout:

$$
\mathrm{E}\left[\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)-\mathrm{K} \mid\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)>\mathrm{K}\right]
$$

- Focus on spread (underlier) itself

$$
\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)
$$

- Hedge spread by selling / buying bonds
- Spread is linear, hedge convex

## Convexity - Adjusting Forward Rates

- Use risk neutral measure for which

$$
\begin{aligned}
& \mathrm{E}\left[\mathrm{PV}\left(\mathrm{Y}_{10}\right)\right]=\mathrm{PV}\left(\mathrm{Y}_{10}{ }^{\mathrm{f}}\right) \\
& \mathrm{E}\left[\mathrm{PV}\left(\mathrm{Y}_{2}\right)\right]=\mathrm{PV}\left(\mathrm{Y}_{2}{ }^{\mathrm{f}}\right)
\end{aligned}
$$

- Find mean of distribution for which

$$
\int_{0}^{\infty} \mathrm{PV}(\mathrm{Y}) \mathrm{g}\left(\mathrm{Y} ; \mathrm{Y}^{\mathrm{m}}, \sigma\right) \mathrm{dY}=\mathrm{PV}\left(\mathrm{Y}^{\mathrm{f}}\right)
$$

- This gives expectation of linear yield

$$
E\left[\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)\right]=\left(\mathrm{Y}_{10}{ }^{\mathrm{m}}-\mathrm{Y}_{2}{ }^{\mathrm{m}}\right)
$$

## Convexity - Adjusting Forward Rates

- Call as expectation of payout:

$$
\mathrm{E}\left[\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)-\mathrm{K} \mid\left(\mathrm{Y}_{10}-\mathrm{Y}_{2}\right)>\mathrm{K}\right]
$$

- PV of call is

$$
\begin{gathered}
\mathrm{NPV}=\mathrm{DF}(3 \mathrm{mth}) s \mathrm{t}^{5}[\phi(\mathrm{~d})+\mathrm{d} \Phi(\mathrm{~d})] \\
\mathrm{d}=(\mathrm{F}-\mathrm{K}) / s \mathrm{t}^{5} \cdot
\end{gathered}
$$

- But F now uses adjusted means

$$
\mathrm{F}=\left(\mathrm{Y}_{10}{ }^{\mathrm{m}}-\mathrm{Y}_{2}{ }^{\mathrm{m}}\right)
$$

## Convexity - Adjusting Forward Rates

- Adjustment is small, but can matter
- For 3 month ATM call
- 2 year 6.225 forward, 6.230 adjusted
- 10 year 6.964 forward, 6.979 adjusted
- Spread 73.8 forward, 74.9 adjusted
- Call 9.1bp off forwards, 9.7bp adjusted

## Convexity - Calculating Adjustment

- Find mean of distribution for which

$$
\int_{0}^{\infty} \mathrm{PV}(\mathrm{Y}) \mathrm{g}\left(\mathrm{Y} ; \mathrm{Y}^{\mathrm{m}}, \sigma\right) \mathrm{dY}=\mathrm{PV}\left(\mathrm{Y}^{\mathrm{f}}\right)
$$

- Various methods
- Brute force numerical integration
- Approximate integrand by piece-wise quadratic
- More sophisticated approximations
- Brotherton-Ratcliffe \& Iben
- spread = ri $\sigma^{2}$ T P' $/$ ( 2 P')

## Convexity - Calculating Adjustment

- Comparison of results
- 3 month forward 2 and 10 year swaps
- Solving integral equation, 0.48bp, 1.55bp
- B-R \& I approximation, 0.48bp, 1.54bp
- 5 year forward 2 and 10 year swaps
- Solving integral equation, 10.2bp, 31.7bp
- B-R \& I approximation, 9.5bp, 32.4bp

## Convexity - Hedging

- Hedge spread as before
- When buy call, sell spread
- Sell spread in delta-weighted amount
- Sell spread, buy 10s sell 2s in DV01-weighted amounts
- But now additional volatility risk
- As volatility changes, convexity changes
- Must hedge volatility exposure

## Convexity - Libor-in-Arrears

- Same situation as for spread
- Libor-in-arrears payment is linear
- Payment at $t$ is $L_{t}$
- Hedge is convex FRA $\left(L_{t}\right)=L_{t} /\left(1+L_{t}\right)$
- Find mean of distribution for which

$$
\int_{0}^{\infty} \operatorname{FRA}(\mathrm{L}) \mathrm{g}\left(\mathrm{~L} ; \mathrm{L}^{\mathrm{m}}, \sigma\right) \mathrm{dL}=\operatorname{FRA}\left(\mathrm{L}^{\mathrm{f}}\right)
$$

## Convexity - Libor-in-Arrears

- Convexity effect is usually small
- Libor usually quarterly
- Swaps not too long
- Example
- Quarterly libor, adjustment 0.5bp at 1yr, 2.4bp at 5 yr
- Annual libor, adjustment 1.8bp at 1yr, 9.2bp at 5yr

## Conclusion

- Tried to show a few applications of
- Discounting Expected Cash Flows
- Use Simplest Model Which Solves Problem
- Focus on Hedging and Managing Risks
- Managing derivatives risk
- Choosing appropriate model \& assumptions
- Focus on hedging and managing risks
- Not about high-powered mathematics

## Problem 1 - Spread Option Price

Parameters for an ATM call spread option are as in the presentation:
3 mth fwd 2 year rate
6.23

3 mth fwd 10 year rate $\quad 6.96$
Forward spread
73.8bp

Spread standard deviation
46 bp
Three-month discount factor
0.9865

1. Calculate the price of the option, using the formula given in the presentation and (if needed) the following approximation for $\Phi(\mathrm{d})$ :

$$
\mathrm{NPV}=\mathrm{DF}(3 \mathrm{mth}) \mathrm{st} \cdot[\phi(\mathrm{~d})+\mathrm{d} \Phi(\mathrm{~d})]
$$

$$
\mathrm{d}=(\mathrm{F}-\mathrm{K}) / \mathrm{st}{ }^{5} \quad \phi(\mathrm{~d})=\exp \left(-\mathrm{d}^{2} / 2\right) /(2 \pi)^{5}
$$

$$
\Phi(\mathrm{d})=\exp \left[-\frac{(83|\mathrm{~d}|+351)|\mathrm{d}|+562}{703 / \mathrm{d} \mid+165}\right] / 2 \quad \Phi(\mathrm{~d})=1-\exp \left[-\frac{(83|\mathrm{~d}|+351)|\mathrm{d}|+562}{703 /|\mathrm{d}|+165}\right] / 2
$$

## Problem 2 - Hedging Spread Option

What precisely is the hedge to the spread option?
Specifically, assume you bought an ATM call with payout $\$ 10,000 / \mathrm{bp}$. In general to hedge a (bought) call you must sell the underlier. In this case, you must sell the 10 yr minus 2 yr yield spread. To sell the yield spread you must buy the 10 year and sell the 2 year forward swaps.

Answer the following specific questions:

1. What is the $\mathrm{P} \& \mathrm{~L}$ on the option if the spread rises by 1 bp ?
2. What is the $\mathrm{P} \& \mathrm{~L}$ on a $\$ 1 \mathrm{~mm}$ position in the 10 year forward swap (with a DV01 of \$701.70)? On the 2 year (with DV01 of $\$ 182.80$ )?
3. How much should you buy of the 10 year and sell of the 2 year?

## Problem 3 - Spread on libor-in-arrears

What is the spread for a libor-in-arrears swap? Specifically, consider the in-arrears side of a 5 year swap against 1 year libor-in-arrears. The forwards and adjusted forwards are as below:
Yr of

Adj
Disc

| pmt | Fwd | Vol | Fwd | Sprd | Fact | P' | P' |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 6.580 | $20 \%$ | 6.596 | 1.7 | 0.9454 | 0.880 | 0.0165 |
| 2 | 6.519 | $20 \%$ | 6.553 | 3.4 | 0.8863 | 0.881 | 0.0165 |
| 3 | 7.037 | $20 \%$ | 7.096 | 5.9 | 0.8314 | 0.873 | 0.0163 |
| 4 | 7.294 | $20 \%$ | 7.380 | 8.6 | 0.7757 | 0.869 | 0.0162 |
| 5 | 7.306 | $20 \%$ | 7.416 | 11.0 | 0.7224 | 0.868 | 0.0162 |

1. Check the Brotherton-Ratcliffe \& Iben approximation for year 5 .
2. Calculate the NPV of the spread (the up-front benefit of in-arrears)
3. Calculate the approximate spread per year, if the 5 year swap rate is 6.656\%ab.

## Problem 3 - Answers

| Yr of <br> pmt | Adj <br> Fwd | Sprd | Disc <br> Fact | NPV <br> (sprd) | B-R\&I | NPV(sprd) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 6.596 | 1.7 | 0.9454 | 1.59 | 1.6 | 1.54 |
| 2 | 6.553 | 3.4 | 0.8863 | 2.98 | 3.2 | 2.83 |
| 3 | 7.096 | 5.9 | 0.8314 | 4.93 | 5.6 | 4.62 |
| 4 | 7.380 | 8.6 | 0.7757 | 6.67 | 7.9 | 6.15 |
| 5 | 7.416 | 11.0 | 0.7224 | 7.91 | 9.9 | 7.19 |
|  |  |  |  |  |  |  |
|  |  |  | bp up-front | 24.09 |  | 22.32 |
|  |  | bp/yr approx | 5.82 |  | 5.39 |  |
|  |  | bp /yr act | 5.70 |  | 5.28 |  |
